

# Food Balance Sheets

## Wheat

For this example, we'll first consider the full process for creating a food balance sheet for wheat. We start off with an empty table:

| Name              | Production | Imports | Exports | StockChange | Food | Feed | Waste | Seed | Industrial | Tourist | Residual |
|-------------------|------------|---------|---------|-------------|------|------|-------|------|------------|---------|----------|
| Wheat             | 0          | 0       | 0       | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Wheat flour       | 0          | 0       | 0       | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Bulgur            | 0          | 0       | 0       | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Breakfast cereals | 0          | 0       | 0       | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Wheat starch      | 0          | 0       | 0       | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Wheat bran        | 0          | 0       | 0       | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |

## Production

For production data, we first fill in the table with any available official figures. To impute production, we must also consider yield and area harvested data as yield is defined as production divided by area harvested (and thus with any two elements the third is uniquely defined). Suppose we have the following official data:

| Name        | Area Harvested | Yield | Production |
|-------------|----------------|-------|------------|
| Wheat       | 18496174       | 0     | 0          |
| Wheat flour | NA             | NA    | 18652048   |

In this case, the production value is only known for wheat flour (it is missing for wheat), and for wheat we are also missing the yield value. The first step in the imputation process is to impute the yield, using the previously described production imputation methodology.

| Name        | Area Harvested | Yield  | Production |
|-------------|----------------|--------|------------|
| Wheat       | 18496174       | 2.9422 | 0          |
| Wheat flour | NA             | NA     | 18652048   |

Now, we have enough information to impute the production data:

| Name        | Area Harvested | Yield  | Production |
|-------------|----------------|--------|------------|
| Wheat       | 18496174       | 2.9422 | 54418808   |
| Wheat flour | NA             | NA     | 18652048   |

Now, we fill in the table with our production values. Production is only imputed for primary products, and so in this case no additional values are filled in.

| Name              | Production      | Imports | Exports | StockChange | Food | Feed | Waste | Seed | Industrial | Tourist | Residual |
|-------------------|-----------------|---------|---------|-------------|------|------|-------|------|------------|---------|----------|
| Wheat             | <b>54418808</b> | 0       | 0       | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Wheat flour       | <b>18652048</b> | 0       | 0       | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Bulgur            | -               | 0       | 0       | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Breakfast cereals | -               | 0       | 0       | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Wheat starch      | -               | 0       | 0       | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Wheat bran        | -               | 0       | 0       | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |

## Trade

For the next example, we'll show how the imputation, mirroring and balancing works. In this case, we just take the country totals and insert into this table.

| Name              | Production | Imports        | Exports         | StockChange | Food | Feed | Waste | Seed | Industrial | Tourist | Residual |
|-------------------|------------|----------------|-----------------|-------------|------|------|-------|------|------------|---------|----------|
| Wheat             | 54418808   | <b>1999076</b> | <b>32789894</b> | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Wheat flour       | 18652048   | <b>341529</b>  | <b>572794</b>   | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Bulgur            | -          | <b>182485</b>  | <b>191273</b>   | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Breakfast cereals | -          | <b>161280</b>  | <b>441097</b>   | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Wheat starch      | -          | <b>624947</b>  | <b>224528</b>   | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Wheat bran        | -          | <b>258937</b>  | <b>2343712</b>  | 0           | 0    | 0    | 0     | 0    | 0          | 0       | 0        |

NOTE (Josh): The trade figures I quote here are based on the US data, but not exactly. We have HS6 trade data, and I can map that to CPC. However, some HS6 codes map to many CPC codes. My understanding is that the historical approach has been to not use split factors and to simply map the quantity straight into one of the CPC codes. For this simple example, I map the HS data to CPC and randomly split it.

## Stock Changes

We now estimate the stock changes. Note that for most products, we assume that countries do not hold stocks. Generally, stocks will only be held for primary level products, and not even all of these products. The numbers below represent the estimated stock changes (by the stock imputation methodology described previously) for the example country we're considering.

| Name              | Production | Imports | Exports  | StockChange    | Food | Feed | Waste | Seed | Industrial | Tourist | Residual |
|-------------------|------------|---------|----------|----------------|------|------|-------|------|------------|---------|----------|
| Wheat             | 54418808   | 1999076 | 32789894 | <b>-230630</b> | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Wheat flour       | 18652048   | 341529  | 572794   | -              | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Bulgur            | -          | 182485  | 191273   | -              | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Breakfast cereals | -          | 161280  | 441097   | -              | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Wheat starch      | -          | 624947  | 224528   | -              | 0    | 0    | 0     | 0    | 0          | 0       | 0        |
| Wheat bran        | -          | 258937  | 2343712  | -              | 0    | 0    | 0     | 0    | 0          | 0       | 0        |

## Food

The allocation to food, on the other hand, can potentially be considered at any processing level, although some commodities (such as wheat) are assumed to not be eaten as such. We impute food consumption numbers for the example country and update the FBS table below.

| Name              | Production | Imports | Exports  | StockChange | Food            | Feed | Waste | Seed | Industrial | Tourist | Residual |
|-------------------|------------|---------|----------|-------------|-----------------|------|-------|------|------------|---------|----------|
| Wheat             | 54418808   | 1999076 | 32789894 | -230630     | 0               | 0    | 0     | 0    | 0          | 0       | 0        |
| Wheat flour       | 18652048   | 341529  | 572794   | -           | <b>18539484</b> | 0    | 0     | 0    | 0          | 0       | 0        |
| Bulgur            | -          | 182485  | 191273   | -           | <b>3684</b>     | 0    | 0     | 0    | 0          | 0       | 0        |
| Breakfast cereals | -          | 161280  | 441097   | -           | <b>98131</b>    | 0    | 0     | 0    | 0          | 0       | 0        |
| Wheat starch      | -          | 624947  | 224528   | -           | 0               | 0    | 0     | 0    | 0          | 0       | 0        |
| Wheat bran        | -          | 258937  | 2343712  | -           | 0               | 0    | 0     | 0    | 0          | 0       | 0        |

## Losses

| Name              | Production | Imports | Exports  | StockChange | Food     | Feed | Waste         | Seed | Industrial | Tourist | Residual |
|-------------------|------------|---------|----------|-------------|----------|------|---------------|------|------------|---------|----------|
| Wheat             | 54418808   | 1999076 | 32789894 | -230630     | 0        | 0    | <b>560306</b> | 0    | 0          | 0       | 0        |
| Wheat flour       | 18652048   | 341529  | 572794   | -           | 18539484 | 0    | -             | 0    | 0          | 0       | 0        |
| Bulgur            | -          | 182485  | 191273   | -           | 3684     | 0    | -             | 0    | 0          | 0       | 0        |
| Breakfast cereals | -          | 161280  | 441097   | -           | 98131    | 0    | -             | 0    | 0          | 0       | 0        |
| Wheat starch      | -          | 624947  | 224528   | -           | 0        | 0    | -             | 0    | 0          | 0       | 0        |

| Name       | Production | Imports | Exports | StockChange | Food | Feed | Waste | Seed | Industrial | Tourist | Residual |
|------------|------------|---------|---------|-------------|------|------|-------|------|------------|---------|----------|
| Wheat bran | -          | 258937  | 2343712 | -           | 0    | 0    | -     | 0    | 0          | 0       | 0        |

## Warning: Standard error for loss data is currently just 20% of loss value,  
## it is not estimated in any way.

## Seed

| Name              | Production | Imports | Exports  | StockChange | Food     | Feed | Waste  | Seed           | Industrial | Tourist | Residual |
|-------------------|------------|---------|----------|-------------|----------|------|--------|----------------|------------|---------|----------|
| Wheat             | 54418808   | 1999076 | 32789894 | -230630     | 0        | 0    | 560306 | <b>1929614</b> | 0          | 0       | 0        |
| Wheat flour       | 18652048   | 341529  | 572794   | -           | 18539484 | 0    | -      | -              | 0          | 0       | 0        |
| Bulgur            | -          | 182485  | 191273   | -           | 3684     | 0    | -      | -              | 0          | 0       | 0        |
| Breakfast cereals | -          | 161280  | 441097   | -           | 98131    | 0    | -      | -              | 0          | 0       | 0        |
| Wheat starch      | -          | 624947  | 224528   | -           | 0        | 0    | -      | -              | 0          | 0       | 0        |
| Wheat bran        | -          | 258937  | 2343712  | -           | 0        | 0    | -      | -              | 0          | 0       | 0        |

## Warning: Standard error for seed data is currently just 20% of seed value,  
## it is not estimated in any way.

## Industrial Utilization

Work in progress...

## Tourist Consumption

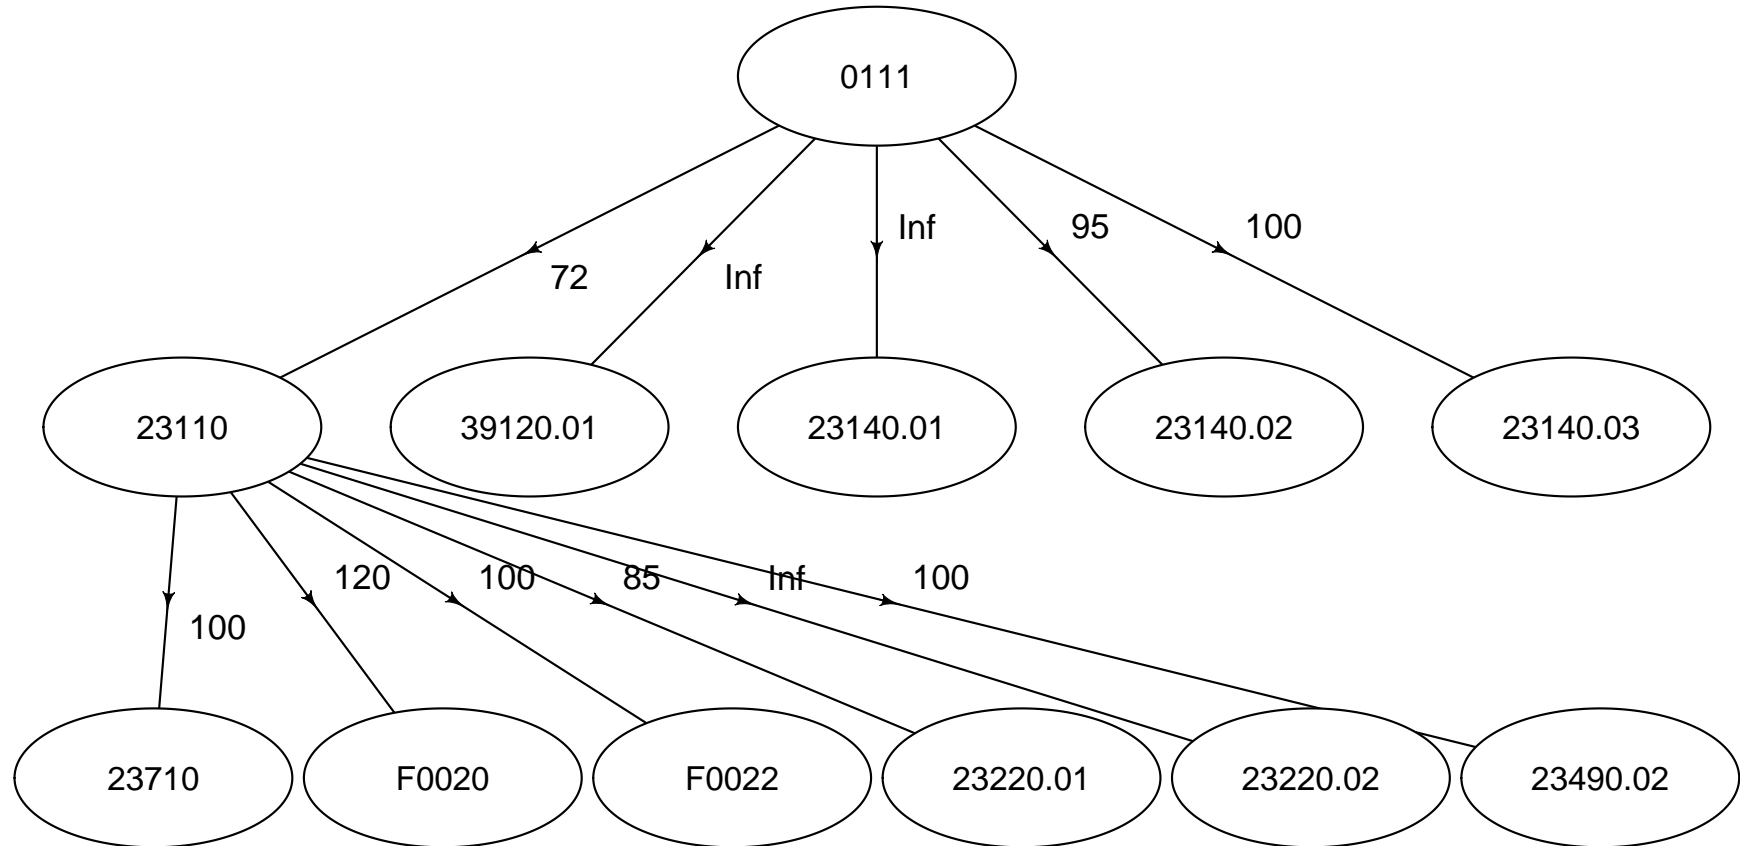

The tourist consumption estimation approach uses tourist data from the WTO as well as last year's consumption patterns to estimate the impact of tourism on local consumption. Note that tourist consumption can be negative; as an extreme example consider a case where many nationals travel abroad but no tourists enter. In this case, that country will certainly have a negative "tourist consumption" because more calories will be assumed abroad than locally.

## Residual Other Uses

Work in progress...

## Standardization

Now, suppose we have the following commodity tree:

NOTE (Josh): This commodity tree above is derived based on the FCL commodity tree. It will likely need to be updated, but for now I just simply map the FCL elements to their corresponding CPC codes.

NOTE (Josh): At this point, we should also compute calories/proteins/fats.

NOTE (Josh): Need to keep track of the standard deviations as well so that we can balance at the end.

We first start with the pre-standardized table:

| Name              | Production | Imports | Exports  | StockChange | Food     | Feed | Waste  | Seed    | Industrial | Tourist | Residual |
|-------------------|------------|---------|----------|-------------|----------|------|--------|---------|------------|---------|----------|
| Wheat             | 54418808   | 1999076 | 32789894 | -230630     | 0        | 0    | 560306 | 1929614 | 0          | 0       | 0        |
| Wheat flour       | 18652048   | 341529  | 572794   | -           | 18539484 | 0    | -      | -       | 0          | 0       | 0        |
| Bulgur            | -          | 182485  | 191273   | -           | 3684     | 0    | -      | -       | 0          | 0       | 0        |
| Breakfast cereals | -          | 161280  | 441097   | -           | 98131    | 0    | -      | -       | 0          | 0       | 0        |
| Wheat starch      | -          | 624947  | 224528   | -           | 0        | 0    | -      | -       | 0          | 0       | 0        |
| Wheat bran        | -          | 258937  | 2343712  | -           | 0        | 0    | -      | -       | 0          | 0       | 0        |

We then compute the required “production” of each of the processed products to satisfy any deficits due to exports or consumption (note that we can allow production to be zero if supply exceeds utilization).

| Name              | Production     | Imports | Exports  | StockChange | Food     | Feed | Waste  | Seed    | Industrial | Tourist | Residual |
|-------------------|----------------|---------|----------|-------------|----------|------|--------|---------|------------|---------|----------|
| Wheat             | 54418808       | 1999076 | 32789894 | -230630     | 0        | 0    | 560306 | 1929614 | 0          | 0       | 0        |
| Wheat flour       | 18652048       | 341529  | 572794   | -           | 18539484 | 0    | -      | -       | 0          | 0       | 0        |
| Bulgur            | <b>12472</b>   | 182485  | 191273   | -           | 3684     | 0    | -      | -       | 0          | 0       | 0        |
| Breakfast cereals | <b>377948</b>  | 161280  | 441097   | -           | 98131    | 0    | -      | -       | 0          | 0       | 0        |
| Wheat starch      | <b>0</b>       | 624947  | 224528   | -           | 0        | 0    | -      | -       | 0          | 0       | 0        |

Since wheat starch is produced from wheat flour, we would first need to ensure the wheat flour food can cover any deficits of wheat starch. However, since wheat starch imports exceed exports plus food, we don’t have to worry about this requirement. Instead, we can just standardize all the first processed level products back to food of wheat.

| Name              | Production (processed) | SD(Production) | Wheat Equivalent | SD(Wheat Equivalent) |
|-------------------|------------------------|----------------|------------------|----------------------|
| Wheat flour       | 18652048               | 0              | 25905622         | 0                    |
| Bulgur            | 12472                  | 884            | 13128            | 931                  |
| Breakfast cereals | 377948                 | 1481           | 377948           | 1481                 |
| Wheat bran        | 2084775                | 0              | 9476252          | 0                    |

Now, we wish to compute the distribution for food for wheat. The main requirement is in the wheat flour, and it should be noted that the 9 million kilogram requirement for wheat bran will automatically be satisfied if the 26 million kilogram requirement for wheat flour is satisfied (as they are by-products). Thus, the food element for wheat has a mean of 26,198 thousand kilograms (the sum of the first three) and a standard deviation of 63 thousand kilograms (the square-root of the sum of the squares of the first three standard deviations). Thus, we now have the following table:

Now, we must balance this table. To do this, we need to extract the computed **standard deviations (is this the word we’re using???)** of each

element. The table below shows the expected value and estimated **standard deviation** for each of the elements for wheat:

| Variable      | Production | Imports | Exports  | StockChange | Food     | Feed | Waste  | Seed    | Industrial | Tourist | Residual |
|---------------|------------|---------|----------|-------------|----------|------|--------|---------|------------|---------|----------|
| Mean          | 54418808   | 1999076 | 32789894 | -230630     | 26296905 | 0    | 560306 | 1929614 | 0          | 0       | 0        |
| Standard Dev. | 2720940    | 0       | 0        | 89854       | 1724     | 0    | 112061 | 385923  | 0          | 0       | 0        |

Note that in this case, the standard deviation for food is very small; this is because it's mostly determined by the production of wheat flour, and this value is an official figure.

### ADD BALANCING HERE

Now, when balancing, we find that food is adjusted down slightly. This adjustment to food of wheat implies that the production of children commodities must also be updated (and hence their food values as well).

| Name              | Production (processed) | SD(Production) | Wheat Equivalent | SD(Wheat Equivalent) | Adjustment |
|-------------------|------------------------|----------------|------------------|----------------------|------------|
| Wheat flour       | 18652048               | 0              | 25905622         | 0                    | 0          |
| Bulgur            | 10910                  | 884            | 11645            | 931                  | 1483       |
| Breakfast cereals | 374197                 | 1481           | 374197           | 1481                 | 3751       |
| Wheat bran        | 2084775                | 0              | 9476252          | 0                    | 0          |

We can now update the production numbers for each of the first level primary elements. Note that in the process of creating flour, we also create bran and germ. The amount of bran and germ created, in this case, is determined by the amount of flour we need to create (as that was our most stringent requirement). Thus, we have:

Additionally, we must enforce consistent shares/extraction rates across grouped commodities (for example, flour/bran/germ) and so when flowing back down we will create excess production of some of the by-products.

### Feed

Feed allocation must be done at this phase in order to ensure that we have reduced the feed demand by the corresponding amounts of feed products (i.e. wheat bran, wheat germ, etc.).

### Balancing
